

Loading Indicators into your MT5 Platform.

Not a lot of difference between MT4 and MT5 here, but there are a couple of things to look out for.

1. **Load the Indicators into your platform.** Open your Mt5 platform, click on the File tab, then click on the Open Data Folders option, and when the new window opens, click on the MQL5 folder to open it. Inside MQL5, locate the Indicators folder. Open it, copy and paste the Indicator(s) into the folder, then close all the open folders and windows. Click on the View tab, open the Navigator window, inside Navigator open the Indicators folder, right click your mouse and select Refresh. This will load the Indicator(s) into your platform and make it/them available for use. *****PLEASE NOTE***** When you go to copy and paste the Indicators into the platform Indicators folder, you will notice additional folders labeled Examples and Market. Ignore those folders for now. Just copy the Indicators into the white space below the folders.

2. **Load the Indicator onto a Chart.** Open a chart for the item you wish to trade. With the Navigator window still open, look for your desired Indicator in the Indicator folder. Drag the Indicator onto the chart you just opened. Most indicators will not require any adjustments and you can simply click the OK button to load onto the chart. In the event you need to make adjustments, you do so just like you would with MT4, although for True/False options, such as alarms, simply click on the default setting once to change it (no more drop-down boxes for True/False options).
